chocolate business project

In this project, we investigated the challenges of a chocolate business.

This project had 3 different parts.

1. At first, we reviewed and analyzed the data frame that includes all the chocolates we have.This data frame contains information such as company name, rating, cocoa percent, and more.

2. In this section, we set a price for chocolates based on their specifications and the research we had conducted. To do this, we utilized the data that we had processed in the previous step and gradually refined our price estimation.

3. In the last step, we identified companies that produce higher-quality chocolates and separated their chocolates. We then updated the chocolate prices accordingly. Additionally, we calculated the income from the sale of chocolates for these companies.
